Executive Summary

Retail Sales Record — October 2025 to September 2026

Overview

This summary covers 140 sales transactions recorded between October 2025 and August 2026, totalling ₦80,259.39 in revenue. The data was cleaned from its original raw form, analyzed across region, product category, and sales channel, and used to build a short-term revenue forecast and an interactive dashboard.

Key Metrics at a Glance

Metric	Value
Total Transactions	140
Total Revenue	₦80,259.39
Reporting Period	Oct 2025 – Aug 2026 (actuals)
Average Order Value	₦573.28
Best-Performing Region	Central (₦21,339.74)
Best-Performing Category	Fashion (₦22,094.57)
Dominant Sales Channel	In-Store (58% of revenue)
Forecast Range (Sep–Nov 2026)	₦8,756 – ₦9,318 / month

Performance by Region

- Central led all regions with ₦21,339.74 across 31 orders, followed by West (₦17,907.02, 33 orders) and South (₦15,547.09, 28 orders).
- North was the lowest-performing region at ₦11,830.19 across 24 orders, despite having the same order count as East, its average order value trailed slightly behind.

Performance by Product Category

- Fashion was the strongest category (₦22,094.57, 32 orders), closely followed by Beauty & Personal Care (₦20,300.34, 30 orders).
- Electronics generated the least revenue (₦9,327.63, 24 orders) despite typically higher unit prices suggesting lower volume rather than lower value per sale.

Sales Channel Split

- In-store sales accounted for 58% of total revenue (₦46,867.64 across 81 orders), against 42% online (₦33,391.75 across 59 orders).
- Online orders carried a slightly higher average discount (7.32%) than in-store orders (6.84%), though the gap is narrow enough not to be a major cost driver on its own.

Monthly Trend & Forecast

Monthly revenue was highly volatile across the reporting period ranging from a low of ₦2,481.89 in December 2025 to a high of ₦12,411.48 in April 2026. A linear trend forecast projects gradual month-on-month growth for September through November 2026, from roughly ₦8,756 to ₦9,318. Given the volatility observed in the historical data, this forecast should be read as a directional estimate rather than a precise target.

Data Quality Notes

- 40 records had inconsistent text casing across Region, Sales Channel, Payment Method, and Order Status - standardized to Proper Case.
- 16 records had extra spacing in Customer Name - trimmed.
- 3 records had inconsistent date formats, manually verified and standardized to YYYY-MM-DD.
- 2 records were missing Quantity and 3 were missing Total Sales recovered using the relationship Total Sales = Quantity × Unit Price × (1 − Discount%) wherever possible.
- 6 records had missing Discount % values left blank rather than assumed to be 0%, to avoid understating true revenue reductions.
- 10 duplicate rows were identified and removed.
- A number of Product and Product Category entries had inconsistent spelling or casing corrected against a standard product list, with dropdown validation added going forward.

Recommendations

- Investigate why North underperforms other regions with a similar order count, a closer look at basket size or product mix there may reveal a fixable gap.
- Monitor the online discount rate, since it is consistently running slightly higher than in-store - confirm this is intentional and not eroding margin unnecessarily.
- Treat the September – November forecast as a planning guide, not a fixed target, given the wide month-to-month swings already observed in the data.
- Continue enforcing the dropdown validation on Product Category to prevent the spelling inconsistencies seen in this cycle from recurring.
